

Amendment to the Claims

1. (Previously Presented) A method in a computer system for providing dynamic addresses for devices, the method comprising:
 - receiving a domain name associated with a device;
 - identifying a dynamic address name associated with the received domain name;
 - sending to a dynamic address system the identified dynamic address name, the dynamic address system having a mapping from dynamic address names to addresses, each device having a dynamic address name and register their address with the dynamic address system;
 - receiving from the dynamic address system an address for the identified dynamic address name; and
 - sending the received address as the address for the device associated with the domain name.
2. (Original) The method of claim 1 wherein the dynamic address system supports instant messaging and the dynamic address name identifies a user of the instant messaging system, the user being a device associated with the address.
3. (Original) The method of claim 1 wherein the device is connected to the Internet.
4. (Original) The method of claim 3 wherein the device is a web server.
5. (Original) The method of claim 1 wherein the address is an IP address.
6. (Original) The method of claim 1 wherein the computer system is a domain name server.

7. (Original) The method of claim 6 wherein the domain name server is a top-level domain name server.

8. (Original) The method of claim 6 wherein the domain name server is a second-level domain name server.

9. (Original) The method of claim 1 wherein the sending of the received address includes sending an indication not to cache the received address.

10. (Original) The method of claim 1 wherein the sending of the received address including sending an indicator to cache the received address for a certain amount of time.

11. (Original) The method of claim 1 including sending to the dynamic address system authentication information along with the identified dynamic address name so that the dynamic address system can authenticate the computer system.

12. (Previously Presented) A method in a computer system of a domain name system for mapping domain names to addresses, the method comprising:

providing a domain name mapping of domain names to intermediate identifiers;

receiving a domain name;

identifying, from an address mapping of intermediate identifiers to addresses that is provided by a system that is external to the domain name system, the domain name mapping an intermediate identifier associated with the received domain name;

identifying from the address mapping an address associated with the identified intermediate identifier; and

sending the identified address as the address of the received domain name.

13. (Original) The method of claim 12 wherein the intermediate identifier is a telephone number.

14. (Original) The method of claim 13 wherein the address mapping maps telephone numbers to addresses of servers where a call to the telephone number is a local call.

15. (Original) The method of claim 13 wherein the telephone number is part of the domain name.

16. (Original) The method of claim 13 wherein a second-level domain name is a telephone number.

17. (Original) The method of claim 13 wherein a third-level domain name is a telephone number.

18. (Original) The method of claim 13 wherein the telephone number is a parameter of a uniform resource identifier that includes the domain name.

19. (Original) The method of claim 12 wherein the intermediate identifier is a dynamic address name.

20. (Original) The method of claim 19 wherein the dynamic address name is a name of a user of an instant messaging system.

21. (Original) The method of claim 19 wherein the address mapping is providing by an dynamic address system.

22. (Original) The method of claim 21 wherein the dynamic address system is an instant messaging system.

23. (Previously Presented) A method in a computer system for providing dynamic addresses for devices, the method comprising:

providing a mapping from dynamic address names to addresses;

receiving from a domain name server that is external to the computer system a dynamic address name associated with a device;

identifying from the provided mapping an address to which the received dynamic address name maps; and

sending to the domain name server the identified address

so that the domain name server can provide the identified address as an address associated with the device.

24. (Original) The method of claim 23 wherein the domain name server maps domain names to dynamic address names.

25. (Original) The method of claim 23 wherein the device is connected to the Internet.

26. (Original) The method of claim 23 wherein the device is a web server.

27. (Original) The method of claim 23 wherein the computer system is an instant messaging system.

28. (Original) The method of claim 23 including receiving an new address for a dynamic address name and updating the mapping to map the dynamic address name to the new address.

29. (Original) The method of claim 23 wherein the addresses are IP addresses.
30. (Original) The method of claim 23 wherein the domain name server is a top-level domain name server.
31. (Original) The method of claim 23 wherein the domain name server is a second-level domain name server.
32. (Previously Presented) A method in a computer system of a domain name system for providing dynamic addresses for resources, the method comprising:
- receiving a uniform resource identifier having a parameter that identifies a resource;
 - identifying a dynamic address name associated with the parameter;
 - sending to a dynamic address system that is external to the domain name system the identified dynamic address name, the dynamic address system having a mapping from dynamic address names to addresses wherein resources have a dynamic address name and have their address registered with the dynamic address system;
 - receiving from the dynamic address system an address for the identified dynamic address name; and
 - sending the received address as the address for resource identified by the parameter.
33. (Original) The method of claim 32 wherein the resource is a device connected to the Internet.
34. (Original) The method of claim 32 wherein the computer system is a web site.

35. (Original) The method of claim 34 wherein the uniform resource identifier is received after a domain name server directs a resolution request for an address to the computer system.

36. (Original) The method of claim 35 wherein the domain name server is a second-level domain name server.

37. (Original) The method of claim 35 wherein the domain name server is a top-level domain name server.

38. (Original) The method of claim 32 wherein the address is an IP address.

39. (Original) The method of claim 32 wherein the dynamic address system is an instant messaging system and the dynamic address name identifies a web site that registered its address with the instant messaging system.

40-72. (Cancelled)
